Symptoms of pulmonary NTM disease:

- **Cough** (persistent or periodic, productive or non-productive).
- May **cough up blood** on one or more occasions.
- **Sweating** and/or fever.
- **Night sweats** are common, and **fever** may be low grade.
- **Weight loss.**
- **Loss of appetite.**
- **Lack of energy.**

**My doctor
Just told me
I have **NTM**.**

**You have
what? I've
never heard
of that.**

**This conversation is
taking place every day.**

NTM Lung Disease,

while statistically a disease that affects women, is not exclusive to them. NTM can affect anyone at any age, with the **most vulnerable being people with underlying lung diseases** or problems such as Cystic Fibrosis, COPD, bronchiectasis and others.

When not diagnosed early and appropriate treatment started,

Research, clinical trials and education

are the keys to making significant progress in helping patients live long, productive lives and changing the outcome for those yet to be diagnosed.

Your support will:

- **FUND RESEARCH** to find better diagnostic tools, drug testing methods and treatments
- **EDUCATE** through patient and physician meetings and Continuing Medical Education conferences
- **CONDUCT DIRECT OUTREACH** to build awareness within the medical community
- **ENROLL PATIENTS** in the NTM Registry to accelerate research

the results can be irreversible and devastating.

And one of the most important things your support can do... is give hope for a better tomorrow.
